## EXECUTIVE SUMMARY

Constellation Energy Generation, LLC (Constellation), has operated fish collection facilities at its Conowingo Hydroelectric Project (Conowingo Project or Project) since 1972. These operations are part of a cooperative private, state, and federal effort to restore American Shad (*Alosa sapidissima*) and other migratory fishes to the Susquehanna River Basin.

The start of operation for the West Fish Lift (WFL) began on March 22, 2022, and the start of operation for the East Fish Lift (EFL) began on March 23, 2022. The WFL and EFL operations continued to June 15, 2022.

The WFL operated for 70 days in 2022 collecting American Shad for transporting upriver to the Columbia Riverfront Park Boat Ramp and the Canal Lock Boat Ramp. The number of lifts conducted in 2022 was 1,397 and fishing time totaled 812 hours and 8 minutes. A total of 489,026 fish of 36 species along with four (4) Tiger Trout (*Salmo trutta* × *Salvelinus fontinalis*), two (2) Splake (*Salvelinus namaycush* × *Salvelinus fontinalis*), fifteen (15) Tiger Muskellunge (*Esox masquinongy* × *Esox Lucius*) and nine (9) Striped Bass (*Morone saxatilis*) hybrids were collected and identified in the WFL sorting tank. Gizzard Shad (*Dorosoma cepedianum*) (468,662), American Shad (2,314), Channel Catfish (*Ictalurus punctatus*) (7,644), and Shorthead Redhorse (*Moxostoma macrolepidotum*) (4,179) dominated the catch and comprised nearly 98.7% of the total fish collected. Gizzard Shad alone accounted for 95.8% of the total fish collected.

The Conowingo East Fish Lift (EFL) operated for 74 days in 2022 collecting American Shad for transporting upriver to the Columbia Riverfront Park Boat Ramp and the Canal Lock Boat Ramp. The number of lifts conducted in 2022 was 1,599 and fishing time totaled 818 hours and 17 minutes. A total of 1,467,565 fish of 35 species along with one (1) Splake, and two (2) Tiger Muskellunge hybrids were collected and identified in the EFL sorting tank. Gizzard Shad (1,456,797), American Shad (2,283), Channel Catfish (2,999), and Shorthead Redhorse (1,080) dominated the catch and comprised nearly 99.7% of the total fish collected. Gizzard Shad alone accounted for 99.3% of the total fish collected.

The Conowingo West Eel Collection Facility (CWECF) was placed in service on April 30, 2022. The facility operated a total of 204 consecutive days from May 1 to November 20, 2022. A total of 139,798 juvenile eels were collected at the CWECF.

## 1 INTRODUCTION

Constellation Energy Generation, LLC (Constellation), is the licensee for the 570.15-megawatt Conowingo Hydroelectric Project (Conowingo Project or Project). The Project is located on the Susquehanna River in Pennsylvania and Maryland. Conowingo Dam is located at river mile 10 in Maryland connecting Cecil and Harford counties, as is the lowermost six miles of the Project reservoir, Conowingo Pond. The remaining eight miles of Conowingo Pond are in Pennsylvania, within York and Lancaster counties.

Constellation filed an Initial Fishway Operation and Maintenance Plan (FOMP) describing Constellation’s fish passage operations and maintenance activities with the Federal Energy Regulatory Commission (FERC) on February 2, 2021. An annual update to the FOMP was filed on January 24, 2022. Project operations through 2022 were in accordance with the January 24, 2022, version of the FOMP, as described within this annual report.

A new 50-year license for the Project was issued to Constellation on March 19, 2021, and this annual report is required by Article 401 and FERC License, Appendix 1, U.S. Department of the Interior Modified Fishway Prescription for the Conowingo Hydroelectric Project No. 405, Section 12.4, which reads,

*By December 31 of each year, the Licensee shall provide an annual report to the Service, FERC, and resource agencies detailing: the implementation of the FOMP, including any deviations from the FOMP and a process to prevent those deviations in the future; any proposed modifications to the FOMP, or in the case of emergencies or project outages, the steps taken by the Licensee to minimize adverse effects on fisheries including any proposed modifications to those steps to further enhance their effectiveness in the future; and operational data for both fishways and the Project to allow the Parties to examine correlations between particular operational patterns and successful or unsuccessful fishway operation, and to confirm, once an operational regime with known effectiveness is settled upon, that the Project continues to operate under that regime. The Service understands that details of operation constitute confidential business information and agrees to protect them from disclosure as such to the extent it is able to do so by law.*

## 2 IMPLEMENTATION

### 2.1 Project Operational and Supporting Data

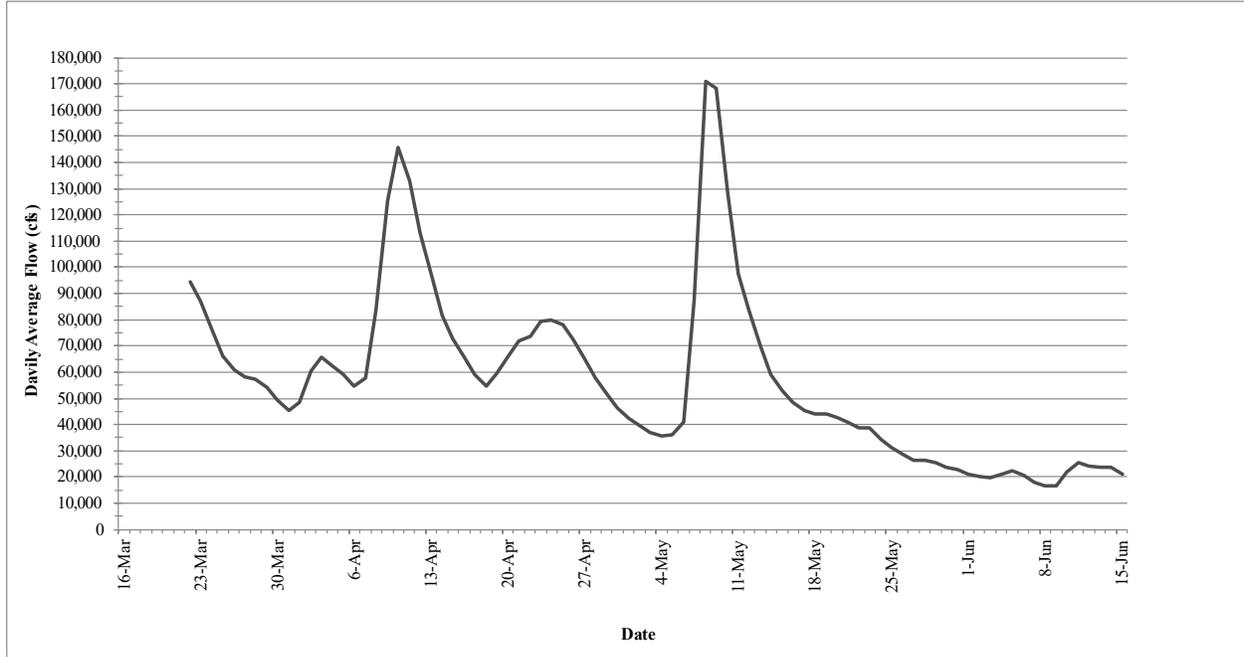

#### 2.1.1 Flow Data USGS Marietta Gage

Maximum, average, median, and minimum daily flows from United States Geological Survey (USGS) streamflow gage located at Marietta, PA (USGS gage no. 01576000) are shown in [Table 2.1.1-1](#) for the 2022 fish passage season (March 22 through June 15). [Figure 2.1.1-1](#) shows a time series of the data, and all values are contained in [Appendix A](#).

**Table 2.1.1-1. Summary of 2022 Flow Data USGS Marietta Gage**

Period	Maximum Daily Flow (cfs)	Average Daily Flow (cfs)	Median Daily Flow (cfs)	Minimum Daily Flow (cfs)
March 22 -June 15, 2022	170,833	57,185	53,504	16,527

**Figure 2.1.1-1. 2022 Average Daily Flow Data USGS Marietta Gage**

**2.1.2 Water Quality Data**

The maximum, average, median, and minimum daily dissolved oxygen concentrations<sup>1</sup> and water temperature<sup>2</sup> are shown in [Table 2.1.2-1](#) and [Table 2.1.2-2](#), respectively, for the 2022 fish passage season (March 22 through June 15). [Figure 2.1.2-1](#) shows a time series of the dissolved oxygen data, and [Figure 2.1.2-2](#) contains a time series of recorded water temperature data. All water quality values are contained in [Appendix B](#).

**Table 2.1.2-1. Summary of 2022 Dissolved Oxygen Data**

Period	Maximum Daily Average Dissolved Oxygen (mg/L)	Average Daily Average Dissolved Oxygen (mg/L)	Median Daily Average Dissolved Oxygen (mg/L)	Minimum Daily Average Dissolved Oxygen (mg/L)
March 22 -June 15, 2022	13.1	10.0	10.3	6.4

<sup>1</sup> For the March 22-April 30 period dissolved oxygen values were recorded twice daily at the WFL while in operation (at 8:00 AM and 6:00 PM). For the May 1-June 15 period dissolved oxygen values were recorded on a 30-minute interval at Monitoring Station 643 located in the Conowingo tailrace, approximately 0.6 miles downstream from the dam.

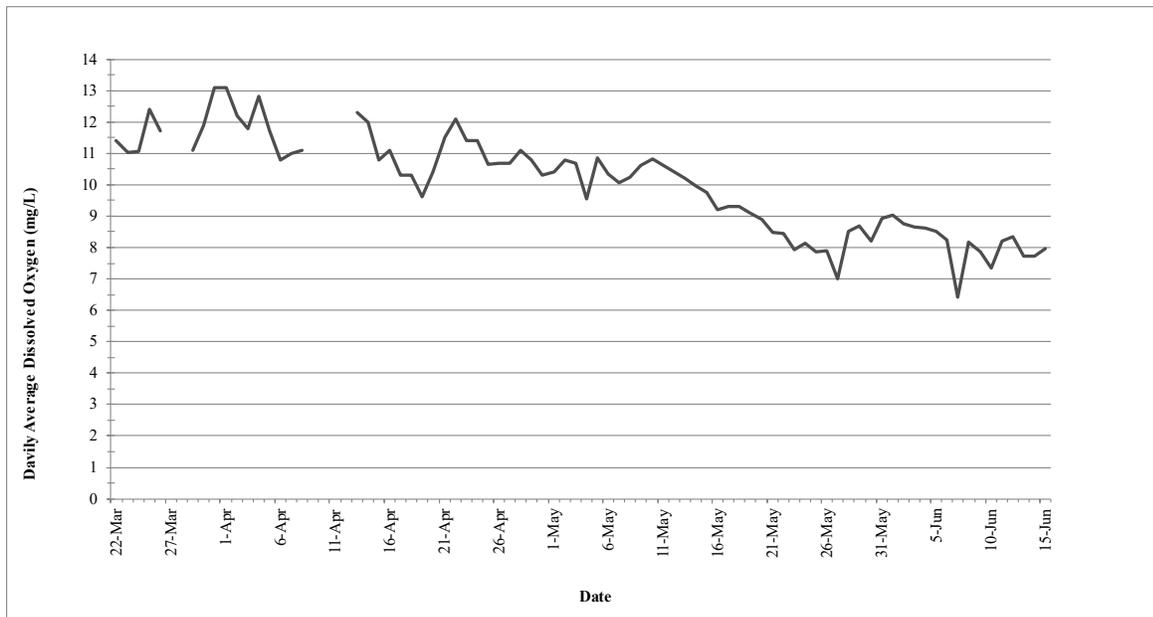

<sup>2</sup> For the entire 2022 fish passage season, temperature values were recorded twice daily at the WFL while in operation (at 8:00 AM and 6:00 PM). Daily average water temperature and dissolved oxygen data recorded from Station 643 has been included for non-operational days during the fish passage season (after May 1).

**Table 2.1.2-2. Summary of 2022 Water Temperature Data**

Period	Maximum Daily Average Water Temperature (°F)	Average Daily Average Water Temperature (°F)	Median Daily Average Water Temperature (°F)	Minimum Daily Average Water Temperature (°F)
March 22 -June 15, 2022	79.9	60.9	57.2	43.7

**Figure 2.1.2-1. 2022 Dissolved Oxygen Data**

**Figure 2.1.2-2. 2022 Water Temperature Data**

### 2.1.3 Project Operations Data

Hourly individual turbine unit operations information, recorded as part of Project operations data, is provided in [Appendix C](#)<sup>3</sup>. For each hourly increment throughout the 2022 fish passage season, the operational status of each turbine is presented as “on” or “off”. Turbines generally began or ended their operation at or near the end of hourly intervals. In instances where turbines are operated less than 30 minutes throughout an hourly period, they are considered “off”.

The planned sequence of turbine operation is provided in [Table 2.1.3-1](#) below and in Section 3.1 of the January 24, 2022 FOMP, which also describes that the schedule may be altered based on unit outages and other operational requirements. Deviations from this sequence occurred in approximately 33% of operating hour time intervals (682 of 2,052 hourly intervals)<sup>4</sup> during the 2022 fish season. The following equipment outages ([Table 2.1.3-2](#)) accounted for approximately 49% of the deviations (333 of 682 hourly intervals).

**Table 2.1.3-1: Turbine Operating Sequence**

Sequence ON/OFF	Unit No. ON	Unit No. OFF
1 <sup>st</sup>	5	1
2 <sup>nd</sup>	7	2
3 <sup>rd</sup>	3	4
4 <sup>th</sup>	6	8

<sup>3</sup> Project operations data is provided from March 22 through November 20, 2022, in [Appendix C](#). However, operations data for September 27, 2022, is missing and not available from the Project operational records.

<sup>4</sup> The WFL ran for 812 hours and 8 minutes of total time and reflect partial hourly intervals (e.g., end time at 1603 hours), however the turbine operation data reflect whole hourly intervals (e.g., end time at 1700 hours).

4	6/15/2022 @ 01:00 hours	6/15/2022 @ 18:40 hours

The hourly individual turbine discharge data and the hourly discharge through the spillway gates for the 2022 American shad and American eel passage seasons (March 22–November 20, 2022) is provided in [Appendix C](#). Constellation records the daily average discharge of each individual turbine rather than recording each turbine’s hourly total discharge. Therefore, the discharge data provided is calculated using each turbine’s daily average discharge and the hourly “on” or “off” status. These values were compared to the Project’s recorded hourly total discharge, which is a record of the discharge from the powerhouse and through the spillway and were generally in agreement. However, values were observed differing at the start and end of a turbine’s operational period. This difference is a result of the calculated data incorporating daily average discharge and therefore not capturing the ramping up or down of the turbine as it begins or ends operation. Additionally, values differ during periods of spillage (e.g., April 8 through April 13, 2022), as the recorded plant discharge includes spillage information.

Minimum flow releases from the Project during the upstream fish passage season followed the schedule outlined in the FERC license. Minimum flows of 3,500 cfs and 10,000 cubic feet per second (cfs) or natural river flow (whichever is less), as measured at the USGS gage at Marietta, PA were maintained for the periods of March 22 to 31 and April 1 to 30, respectively. A minimum flow of 7,500 cfs or natural river flow (as previously noted) was maintained for the period of May 1 to 31. A minimum flow of 5,000 cfs or natural river flow (as previously noted) was maintained for the period of June 1 to September 14. A minimum flow of 3,500 cfs or natural river flow (as previously noted) was maintained for the period of September 15 to November 30.

## 2.2 Fish Passage Facilities

### 2.2.1 Conowingo West Fish Lift

#### 2.2.1.1 Staffing

During the 2022 fish passage facility operating season, trained and qualified individuals were on site to operate the West Fish Lift (WFL). The WFL operating crew included a supervising biologist, lift operator, and biological technicians. All fishway operational personnel reviewed and understood the FOMP.

The supervising biologists and lift operators were responsible for operating mechanical and electrical equipment associated with the WFL. The lift operators set the equipment as directed by the supervising biologist. The lift operators adjusted equipment settings throughout the course of each day as hydraulic conditions changed so attraction flows from, and in, the WFL were optimized. The supervising biologists provided technical guidance on all aspects of daily operation at the WFL and were responsible for fine tuning the operation to assure the best possible efficiency. In addition, the supervising biologist was responsible for establishing fishing time and lift frequency, and mobilizing transport units and personnel, which is based on fish abundance that can change throughout the day and the season. The supervising

biologist oversaw collection of all data, ensure their accuracy, produced daily and weekly reports, and distributed reports via email to all pertinent Constellation and resource agency personnel.

#### 2.2.1.2 Maintenance

Pre-season maintenance and post-season maintenance measures took place as outlined in the January 24, 2022 version of the FOMP.

Constellation utilizes an electronic work management platform to manage maintenance tasks including tasks associated with the pre-season and post-season maintenance activities of the fish passage facilities. Several tasks are setup in the work orders for pre- and post-season maintenance. Completion of activities is recorded in the work management system as well as any findings and follow up required. Work orders are included in [Appendix D](#) and are scheduled well in advance of the completion date to allow time for vendors to be on-site. Pre-season and post-season maintenance checklists from this work management platform were completed in accordance with the FOMP.

#### 2.2.1.3 Operation

The 2022 fish passage season at the WFL began on March 22 and continued through June 15<sup>5</sup>. The WFL operated for a total of 812 hours and 8 minutes and completed 1,397 lifts for the 2022 season ([Table 2.2.1.3-1](#)). The hours of daily operation, including the starting and ending time of daily fish operations, are listed in [Appendix E](#).

**Table 2.2.1.3-1: Summary of Operations at the Conowingo West Fish Lift, March 22 – June 15, 2022**

Total Number of Days Operations Occurred	Total Time of Operation (hr:min)	Total Number of Lifts Operated
70	812:08	1,397

##### 2.2.1.3.1 Fish Counts, Transport, and Stocking

A total of 489,026 fish of 36 species along with four (4) Tiger Trout (*Salmo trutta* × *Salvelinus fontinalis*), two (2) Splake (*Salvelinus namaycush* × *Salvelinus fontinalis*), fifteen (15) Tiger Muskellunge (*Esox masquinongy* × *Esox Lucius*) and nine (9) Striped Bass (*Morone saxatilis*) hybrids were collected and identified in the WFL sorting tank during the 2022 season.

Target native and non-native fish counts are summarized in [Table 2.2.1.3.1-1](#). Of the 3,275 target native species collected, 181 were sacrificed and there was a total of 28 mortalities. All target non-native species collected were sacrificed except for one Northern Snakehead, which is due to one escaping (leaping) from the WFL sorting tank prior to the technicians entering the WFL sorting tank. The count<sup>6</sup> of all fish species captured at the lift are additionally contained in [Appendix E](#). The number of fish species trapped and transported, including date, time, and location of release is additionally provided in [Appendix F](#).

During the 2022 season, the WFL collected one (1) American Shad (*Alosa sapidissima*) that was previously captured, Floy-tagged and released downstream of Conowingo Dam by the Maryland Department of

---

<sup>5</sup> The WFL did not operate on March 27 and 28, April 9-12, May 7-11 and 23, and June 4, 5, 11, and 12, 2022.

<sup>6</sup> During trap and transport operations, the counts are recorded per each lift, not by the hour.

Conowingo Hydroelectric Project  
FERC Project Number 405  
Fishway Operation and Maintenance Plan – 2022 Annual Report

---

Natural Resources (MDNR). Per the 2022 FOMP operational guidelines, all re-captured MDNR tagged American Shad from the current year (2022) were transported upriver. Any MDNR tagged American Shad collected from previous years (prior to 2022) were to be sacrificed for study. No MDNR tagged American Shad from previous years were collected in 2022. A summary of Floy-tagged American Shad collected at the WFL is provided in [Table 2.2.1.3.1-2](#).

Conowingo Hydroelectric Project

<i>Dominant Species</i>								
Gizzard Shad	468,662	95.84%	0	0	n/a	n/a	n/a	n/a
Channel Catfish	7,644	1.56%	0	0	n/a	n/a	n/a	n/a
Shorthead Redhorse	4,179	0.85%	0	0	n/a	n/a	n/a	n/a
<b><i>All Species</i></b>	<b><i>489,026</i></b>							

**Table 2.2.1.3.1 2: Summary of Floy-tagged American Shad Collected at the Conowingo West Fish Lift, March 22 - June 15, 2022**

Tag Number	Sex of Fish	Date Tagged <sup>7</sup>	Date Collected	Days at Large	Disposition
10022	F	4/29/2022	5/17/2022	18	Transported

#### 2.2.1.4 Biological Sampling

Life history information (length, weight, sex, spawning condition, scales and otolith samples) was taken from American Shad that were sacrificed or died (lift, holding, or transport mortalities). During the 2022 season, a total of 0 lift mortalities, 6 holding mortalities, and 5 transport mortalities of American Shad occurred at WFL. A total of 47 American Shad were sacrificed from the WFL catch for life history information, comprised of 30 males and 17 females.

Several river herring, (778 Alewife (*Alosa pseudoharengus*) and 183 Blueback Herring (*Alosa aestivalis*)) were collected during the 2022 season. A total of 78 alewife and 56 blueback river herring were sacrificed from the WFL catch for life history information.

The collected biological sampling information from sacrificed adult American Shad and river herring is provided in [Appendix G](#). Additionally, summaries of American Shad mortalities are included in [Appendix E](#).

### 2.2.2 *Conowingo East Fish Lift*

#### 2.2.2.1 Staffing

During the 2022 fish passage facility operating season, trained and qualified individuals were on site to operate the East Fish Lift (EFL). The EFL operating crew included a supervising biologist, lift operator, and biological technicians. All fishway operational personnel reviewed and understood the FOMP.

The supervising biologists and lift operators were responsible for operating mechanical and electrical equipment associated with the EFL. The lift operators set the equipment as directed by the supervising biologist. The lift operators adjusted equipment settings throughout the course of each day as hydraulic conditions changed so attraction flows from, and in, the EFL were optimized. The supervising biologists provided technical guidance on all aspects of daily operation at the EFL and were responsible for fine tuning the operation to assure the best possible efficiency. In addition, the supervising biologist was responsible for establishing fishing time and lift frequency, and mobilizing transport units and personnel, which is based on fish abundance that can change throughout the day and the season. The supervising biologist oversaw collection of all data, ensure their accuracy, produced daily and weekly reports, and distributed reports via email to all pertinent Constellation and resource agency personnel.

#### 2.2.2.2 Maintenance

Pre-season maintenance and post-season maintenance measures took place as outlined in the January 24, 2022 version of the FOMP. Work orders are included in [Appendix D](#). Pre-season and post-season maintenance checklists from this work management platform were completed in accordance with the FOMP.

---

<sup>7</sup> Date Floy tagged provided by Maryland Department of Natural Resources (MDNR).

2.2.2.3 Operation

The 2022 fish passage season at the EFL began on March 23 and continued through June 15<sup>8</sup>. The EFL operated for a total of 818 hours and 17 minutes and completed 1,599 lifts for the 2022 season ([Table 2.2.2.3-1](#)). The hours of daily operation, including the starting and ending time of daily fish operations, are listed in [Appendix E](#).

**Table 2.2.2.3-1: Summary of Operations at the Conowingo East Fish Lift, March 23 – June 15, 2022**

Total Number of Days Operations Occurred	Total Time of Operation (hr:min)	Total Number of Lifts Operated
74	818:17	1,599

2.2.2.3.1 Fish Counts, Transport, and Stocking

A total of 1,467,565 fish of 35 species along with one (1) Splake, and two (2) Tiger Muskellunge hybrids were collected and identified in the EFL sorting tank during the 2022 season.

Target native and non-native fish counts are summarized in [Table 2.2.2.3.1-1](#). The count<sup>9</sup> of all fish species captured at the lift are additionally contained in [Appendix E](#). The number of fish species trapped and transported, including date, time, and location of release is additionally provided in [Appendix F](#).

During the 2022 season, the EFL collected six (6) American Shad (*Alosa sapidissima*) that was previously captured, Floy-tagged and released downstream of Conowingo Dam by MDNR. Per the 2022 FOMP operational guidelines, all re-captured MDNR tagged American Shad from the current year (2022) were transported upriver. Any MDNR tagged American Shad collected from previous years (prior to 2022) were to be sacrificed for study. No MDNR tagged American Shad from previous years were collected in 2022. A summary of Floy-tagged American Shad collected at the EFL is provided in [Table 2.2.2.3.1-2](#).

---

<sup>8</sup> The EFL did not operate on March 27 and 28, April 10-11, May 8-10, and June 4, 5, 11, and 12, 2022.

<sup>9</sup> During trap and transport operations, the counts are recorded per each lift, not by the hour.

#### 2.2.2.4 Biological Sampling

Life history information (length, weight, sex, spawning condition, scales and otolith samples) was taken from American Shad that were sacrificed or died (lift, holding, or transport mortalities). During the 2022 season, a total of 0 lift mortalities, 24 holding mortalities, and 1 transport mortality of American Shad occurred at EFL. In addition, there were a total of 37 American shad and two (2) blueback herring transfer skid mortalities. Also, there were 91 American shad mortalities from fish that were collected and held for potential use in the American Shad pneumatic transport system study. These fish were not actually used in the study data. See 100% survival of test fish in [Table 2.2.2.4.1.-1](#). A total of 45 American Shad were sacrificed from the EFL catch for life history information, comprised of 27 males and 18 females.

Several river herring, (1 Alewife (*Alosa pseudoharengus*) and 94 Blueback Herring (*Alosa aestivalis*)) were collected during the 2022 season. A total of 1 alewife and 51 blueback river herring were sacrificed from the EFL catch for life history information.

The collected biological sampling information from sacrificed adult American Shad and river herring is provided in [Appendix G](#). Additionally, summaries of American Shad mortalities are included in [Appendix E](#).

##### 2.2.2.4.1 Gizzard Shad and American Shad Whooshh System Testing Summary

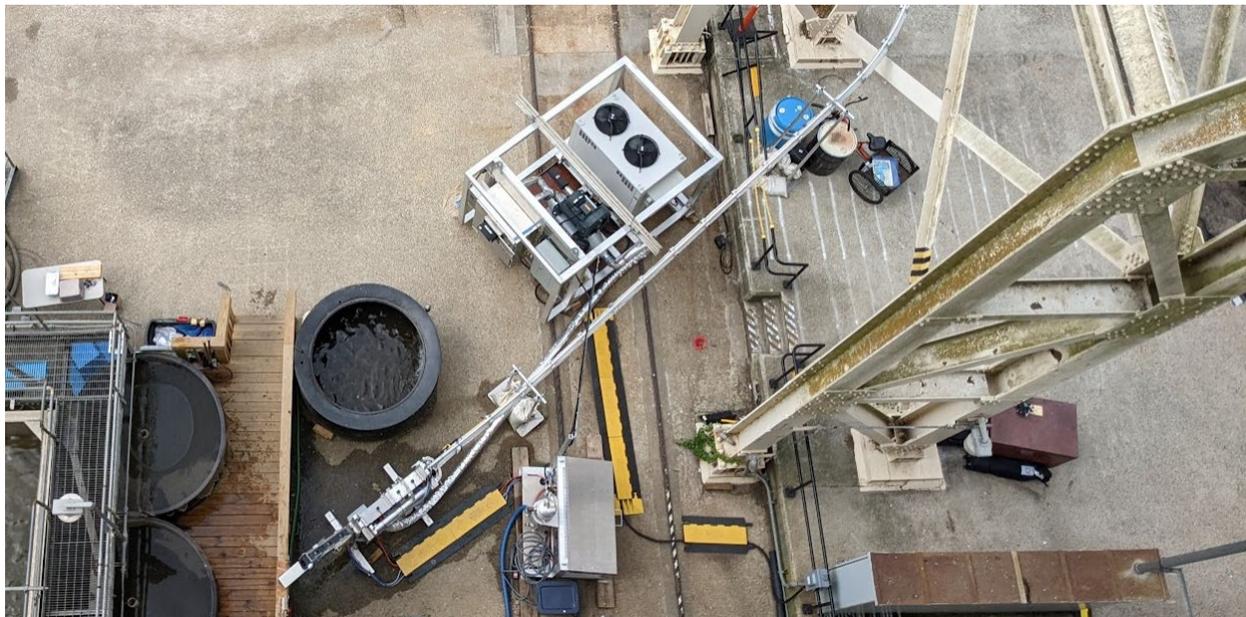

A custom hand fed pneumatic American Shad transport system was installed on the downstream face of the Conowingo Dam as a means of transferring live adult American Shad from the EFL to the WFL ([Figure 2.2.2.4.1-1](#)). The shad transport system goals were to reduce transport time of American Shad from the EFL to the WFL, streamline the American Shad handling and manual loading process, improve operational safety in the powerhouse, and was evaluated for reduced fish stress as measured by mortalities. A single Whooshh Migrator™ T-123 sized tube was selected for the 2022 test evaluation, to ensure passage of the largest American shad anticipated based on historical size data. Gizzard and American Shad actually used in the studies per study protocol are described below in [Table 2.2.2.4.1-2](#).

<sup>10</sup> Date Floy tagged provided by Maryland Department of Natural Resources (MDNR).

*Pre-American Shad: Test Results – Gizzard Shad at Conowingo*

A Gizzard Shad test was conducted in advance of the American Shad arrival in the spring of 2022, utilizing the Gizzard Shad as a surrogate for American Shad passage assessment. American Shad and river herring species are sensitive, they do not fair well when held for multiple days, they lose scales when handled and hemorrhage easily, including when held in a tank or container for extended periods. The Whooshh Innovations Inc. made American Shad transport system was used and tested for safe passage as compared to an EFL tank held, non-transferred, control group of Gizzard Shad.

**Figure 2.2.2.4.1-1. American Shad Study Handling Transfer Area**

The pre-test and separate testing of Gizzard Shad were completed before drafting the operational protocol and transitioning to the American Shad testing. Gizzard Shad were collected at the EFL, and the height of each fish was measured for suitability for transport through the American Shad T-123 transport system. The Gizzard study protocol defined the transport fish size limits, blower speed settings for safe passage and re-entry speed into the WFL receiving tank, holding time <48 hours (spanning fish lift, sorting tank, transport and overnight tank hold), randomization of study group fish with test and control group sizes ~equal. After each fish was measured, Floy-tagged, and quickly assessed for any injuries, it was placed in a holding tank at the EFL until enough fish were tagged and documented for passage through the Whooshh system.

On any day, once the Whooshh system was turned on and readied for fish transport, each fish was carefully netted, Floy tag number recorded, then alternately placed in the Whooshh system and transported to the WFL receiving tank (“Test Fish”) or an EFL control holding tank without transport (“Control Fish”). Fish were held overnight, and on the following morning all fish in the EFL control and WFL test holding tanks were inspected for injuries and/or mortality.

For the Gizzard Shad pre-test, a total of 196 fish were sent through the Whooshh system and 195 fish were placed in the control holding tank. During the post-assessments the next day, all transported test and all control fish were observed to be alive, however some of the test fish had additional observed injuries. The

purpose of the pre-test period was to apply adaptive management processes, to identify potential injury sources, and to make system adjustments to optimize the conditions for safe passage of Gizzard Shad.

Actual Gizzard Shad testing of the Whooshh system occurred on April 9 and 13 ([Table 2.2.2.4.1-1](#)). A total of 103 test fish were released through the Whooshh system and 105 control fish were placed in the control holding tank on April 9. Post-assessment on April 10 revealed 102 alive test and 105 alive control fish. One fish was removed because it was dropped when placing it into the Whooshh system. An additional test was conducted on April 13, when 110 test and 110 control fish were utilized. Post-assessment on April 14 revealed 109 alive and 1 dead test fish. All control fish were alive at the post-assessment. It was determined that there was no statistical difference between the control fish and the test fish and the American shad study could go forward.

#### *Changes made prior to American Shad Testing*

After the completion of the Gizzard Shad testing, a very small number of American Shad started to be collected at the fish lifts. April 21-23, with only five American Shad available at the EFL, Whooshh personnel adapted the system to the profile of American Shad: tube rails adjusted, fish size limits with specific blower speeds defined to ensure safe passage and safe tube exit speeds which were added to the American Shad protocol. With the limited numbers of American Shad available for system calibration, the collected fish were recycled and re-used for repeated tube transport. As for the Gizzard Shad, there was an American shad pre-test phase wherein the testing procedure was modified to facilitate protocol test conditions were met. Active adaptive management of the on-site procedures to ensure normal system operation, such as increasing the frequency to daily replacement of the tube misting filters, after a higher water event increased trapped sediment and reduced tube misting performance when not maintained daily, was observed during the testing phase for American Shad.

Note: the average width of the American Shad is substantially larger than that of the average Gizzard Shad, however, it was only learned and confirmed on site by Whooshh personnel that the average size of the American Shad has been decreasing in the last decade resulting in a 2022 American Shad population that was generally too small for optimal passage through the installed T123 tube, which had been selected based size data collected more than a decade prior. Not having a smaller T-105 tube installed meant that for study purposes only the larger American Shad, appropriate for the T-123 tube could be properly evaluated.

#### *American Shad Test Procedures at Conowingo*

American Shad were collected at the EFL, and the height of each fish was measured to thereby approximate the fish girth size and suitability for the installed T-123 tube. [Typically girth size is automatically measured by the Whooshh FishL™ Recognition system, but it was determined that in 2022 such function would be performed manually, and the delivered Whooshh FishL Recognition system would be used to collect images of invasive species for potential future sorting algorithm AI use]. After each fish was measured, Floy-tagged, and visually assessed for any injuries, it was placed in a separate holding tank at the EFL until enough appropriately sized American Shad were tagged and documented for (i) passage through the test transport system and (ii) the control group.

American Shad collected and transported on May 4th through May 17th define the American Shad study period. As the American Shad testing continued over an extended number of days due to low count numbers at the EFL as well as lack of shad that were the proper size for the tube, it was determined that the extra handling during height measurements, Floy tagging, and injury assessment was adding extra stress to the fish. Therefore, as water temperatures increased, only the American Shad minimum height was checked to

make sure the fish was suitable for the T-123 sized transport system. Unfortunately, during this time there was a high-water event that shut down the EFL and WFL for a week with the American shad returning slowly and in smaller numbers, thereafter, limiting American Shad availability. An agency demonstration day was planned May 18-19 and the few American shad captured over the previous days were held to ensure some fish availability for the demonstration. On the demonstration days, all the collected fish were transported through the Whooshh system. No fish were held as controls and the overall study operational protocol was not strictly followed. In addition, during morning testing on the demonstration day, there was a miscommunication as to the readiness status at the WFL receiving tank and fish were transported to a WFL holding tank without adequate water, causing injury and impacting survival. This further reduced the available test fish and control fish. For these reasons, the fish used for the demonstration day were excluded from the study period.

#### *American Shad Test Results at Conowingo*

Presented below are the data for which complete datasheets recorded by Normandeau were paired with Whooshh autonomously generated control system transport data. Note the dates correspond to the date of fish group assignment as test (Whooshh transport) or control (EFL hold). These encompass the dates May 4 through May 17, 2022 and exclude all demonstration day data for the reasons described in the previous section. The known histories of the American Shad that were transported through the Whooshh system and the control American shad that were held without transport are presented. The American Shad where the study protocol were achieved are presented in [Table 2.2.2.4.1-2](#) below.

Of the total 144 control and test fish that satisfied the study protocol criteria, 96% of the control American Shad survived and 100% of the Whooshh test shad transport system fish survived. [Table 2.2.2.4.1-2](#) data only includes test and control fish that were collected and handled per study protocol. Study Protocol specifications met were:

- Fish size ( height)
- Fish holding time
- Blower speed setting with specified range
- Correct equipment operation
- Comparable Test and Control groups
- Randomization of group assignment

The individual fish data and calculations are shown in [Table 2.2.2.4.1-2](#).

#### *Summary Results*

The study plan goals were two test scenarios of 50 American Shad per test/control group, but only after the first 50 pre-test American Shad to work through operational familiarity and system installation adjustments from Gizzard Shad to American Shad. The low American Shad fish counts at EFL and available for the study meant that more test days, with smaller numbers and batches, were conducted in an attempt to achieve a total evaluation > 100 fish per group, while maintaining the protocol defined conditions related to fish size, fish holding time, blower speed, proper equipment operation, comparable test and control groups, and randomization of group assignment. The Per Protocol data set numbers did not quite achieve the 100 fish

FERC Project Number 405  
Fishway Operation and Maintenance Plan – 2022 Annual Report

---

count ([Table 2.2.2.4.1-2](#), 67 test and 77 controls). However, the 100% test group survival and 96% control group survival rates of the Per Protocol data suggest that the Whooshh system provides safe, rapid, effective, and efficient fish passage after approximately 900 feet of transport.

*[Note: Two additional tables are presented in [Appendix H](#) which include American Shad which did not meet the study protocol criteria for one or more reasons (e.g., were held too many days prior to test/assessment). It was determined that the data presented in the two tables in [Appendix H](#) cannot be included in study test results in [Table 2.2.2.4.1-2](#) above without introducing variable uncertainty. Further, there are no “Unknown fish group” or “Unknown Status” data included in in any table in this report for fish collected at the EFL for potential use in the American Shad study. Total American Shad count recorded by on site personnel included a total of 152 unknown fish and 149 of unknown status at the EFL. These “unknown” fish are excluded from the study and have been omitted for purposes of this test/study report but are referenced in [Appendix H](#), but only for the purposes of providing insight into the total American Shad EFL counted by on-site personnel. For these reasons, only the data presented in [Table 2.2.2.4.1-2](#) above should be relied upon for the American Shad Study, and not the additional data presented in the tables in [Appendix H](#).]*

### 2.2.3 *Conowingo West Eel Collection Facility*

The Conowingo West Eel Collection Facility (CWECF) was operated as described in the January 24, 2022 FOMP. Operation began on May 1, 2022 and continued to November 20, 2022.

#### 2.2.3.1 Staffing

Trained and qualified individuals operated the facility throughout the eel passage season. A supervising biologist oversaw all operations with the assistance of biologists and biological technicians. Daily facility checks were completed by a crew of two trained personnel. All personnel had reviewed and understood the FOMP.

#### 2.2.3.2 Maintenance

##### *Pre-season Maintenance*

In April 2022, all eel passage facility components, including the eel ramp, collection, overflow, and holding tanks, as well as the associated water lines were installed and tested. All components were in working order before the facility was placed into service on April 30, 2022.

##### *Post-season Maintenance*

After the season ended on November 20, 2022, the eel facility components were dismantled, cleaned and stored. The collection, overflow, and holding tanks, as well as the water lines were stored appropriately for the winter period.

#### 2.2.3.3 Operation

Throughout the 2022 season, the eel passage facility monitoring crew notified pertinent Station personnel of their arrival each day, conducted a pre-job safety briefing, informed the Station that eel passage operations will commence, and asked for a dissolved oxygen (DO) tailrace reading and if any issues have been recorded since completion of the last eel passage facility check.

Flow rates for the trapping, collecting, and holding processes are the primary metric used to evaluate whether the facility is operating within design parameters. If flows are within the design parameters, then the facility would be operating properly. Additionally, continuous measurements of water temperature and dissolved oxygen as well as visual inspections during daily operation determine if the facility is operating normally and that conditions are suitable for collecting and holding juvenile eels. The continuous monitors are equipped with alarms that alert personnel when any of the measured parameters are not within design parameters. The proper operation of the continuous monitors and associated alarms was verified regularly. When daily eel sampling was complete, the eel passage facility monitoring crew notified pertinent Station personnel of any major changes to the facility and that the crew is leaving the site.

There were no significant problems encountered with the trapping, collecting, or holding systems. The total attraction flow of the facility varied throughout the season dependent upon which tanks were in-service, but an attraction flow was always being discharged down the ramp and shoreline. Periodically throughout the season, low flow alarms did occur. Slight adjustments made to the individual tank feed pipes to adjust the output to these feed pipes to obtain a constant water flow into the tanks resolved this issue. Cleaning and calibration activities were conducted at least weekly during the season. [Table 2.2.3.3-1](#) provides a summary of the alarm notifications and corrective action taken during the season.

The statistics of the operational parameters for the main components of the CWECF are provided in [Table 2.2.3.3-2](#). The total attraction flow, collection tank fill, and collection tank drain information was

Conowingo Hydroelectric Project  
 FERC Project Number 405  
 Fishway Operation and Maintenance Plan – 2022 Annual Report

---

collected as part of the calibration of flows at the CWECF. Calibration of the ramp flow was executed each week after cleaning, using a 19-L graduated bucket. Multiple locations at the facility were checked for calibration purposes - the spray bar, the collection tank fill and drain, scent line, and the drains of each of the holding tanks that were in-service. Some of the water from the spray bar that was not used for attracting eels up the ramp but used to help slide eels into the collection tank was identified as the backside of ramp flow. The backside of ramp flow was calculated by adding the scent line to the collection tank drain and subtracting the collection tank fill. The attraction flow at the top of the ramp (top attraction) was calculated by subtracting the backside of ramp flow from the spray bar amount. Bottom of ramp attraction is a sum of the collection tank drain and the drains of the in-service holding tanks. Total attraction flow is equal to the collection tank fill, the spray bar and the drains of the holding tanks. Details and calibration records are provided in [Appendix I](#). After calibration readings were taken adjustments, if necessary, were made to the facility to ensure that at least 70 gallon per minute (gpm) of attraction flow was provided.

Daily temperature measurements were taken in the CWECF collection tank and the dissolved oxygen records were collected from the Project control room (Station 643).

**2.2.3.3.1 Eel Counts, Transport and Stocking**

A total of 120,755 American Eel (*Anguilla rostrata*) were collected and 120,666<sup>11</sup> were stocked within the Susquehanna River watershed. [Figure 2.2.3.3.1-1](#) provides a summary of the annual American Eel catches at the CWECF from the 2017 through 2022 seasons. There was a total of 50 mortalities observed during collection and 215<sup>12</sup> (0.5% mortality) juvenile eels were recovered dead from the holding tanks over the entire season.

The CWECF data required as part of this annual report (i.e., the estimated number of juvenile eels captured each day, number of eels in the holding tanks, and calibration records) has been extracted from the 2022 Conowingo West Eel Collection Facility report and are provided in [Appendix J](#).

**Table 2.2.3.3-1. Conowingo West Eel Collection Facility 2022 Alarms and Corrective Actions**

Date	Time	Alarm	Corrective Action
6/3/2022	1805	Collection Tank- low DO	Replaced Malfunctioning DO/Temp Probe
7/22/2022	0748	Collection Tank - low flow	Increased flow into tank
7/22/2022	1034	Collection Tank - low flow	Increased flow into tank
7/22/2022	1036	Holding Tank - low DO	False alarm, tank was disabled, no eels being held
7/22/2022	1040	Collection Tank - low flow	Increased flow into tank
7/25/2022	0815	Collection Tank - low DO	Alarm occurred when probe was out of water when removing eels during daily check
8/8/2022	0654	Holding Tank 1 - low DO	Changed an oxygen bottle
8/24/2022	0757	Collection Tank - low flow	Increased flow into tank
9/8/2022	1556	Collection Tank - low flow	Increased flow into tank

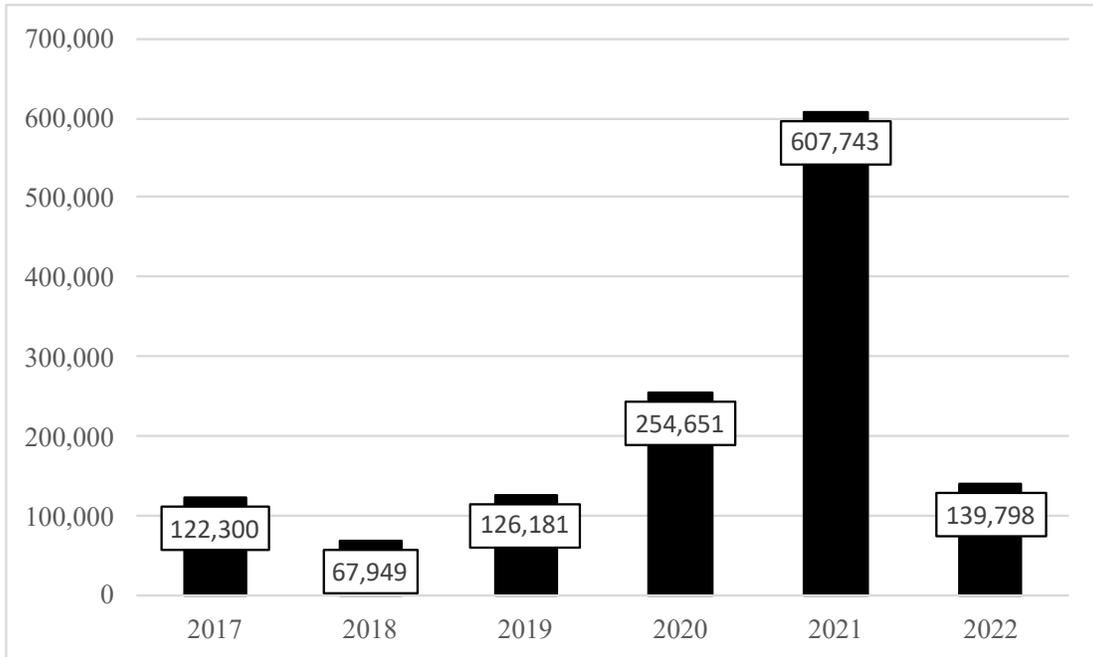

<sup>11</sup> American Eels collected from Constellation’s Octoraro Creek Eel Collection Facility are included in this total.

<sup>12</sup> American Eels collected from Constellation’s Octoraro Creek Eel Collection Facility are included in this total.

**Table 2.2.3.3-2. Conowingo West Eel Collection Facility 2022 Operations Summary**

Operational Parameter	Maximum Value	Average Value	Minimum Value
Total Attraction Flow (gpm)	87.8	69.5	44.9
Collection Tank Fill (gpm)	28.0	15.7	8.5
Collection Tank Drain (gpm)	27.5	16.3	9.0
Collection Tank Temperature (°F)	86.0	72.0	45.1
Dissolved Oxygen at Station 643 (mg/L)	12.9	8.2	5.6

**Figure 2.2.3.3.1-1: Annual Number of Eels Captured at the Conowingo West Eel Collection Facility, 2017-2022**

### 3 DEVIATIONS

Aside from the turbine operation sequence deviations noted in [Section 2.1.3](#), operations data is missing and not available from the Project operational records for September 27, 2022, and is therefore not included in [Appendix C](#). The Conowingo upstream fish passage facilities experienced no deviations from the approved January 24, 2022 FOMP during the 2022 fish passage season, and operations and maintenance of the facilities were conducted in conformance with the FOMP.

### 4 PROPOSED MODIFICATIONS

No major modifications are proposed for the 2023 fish passage at either the EFL, WFL, or CWECF. The Resource Agencies and Constellation agreed that Constellation will continue to implement sorting of all fish that enter the EFL and WFL, and no volitional passage will occur.

The EFL and WFL will be operated for trap and transport using existing sorting and holding tank(s). In accordance with the License conditions, Constellation will trap and transport up to 80% of the American Shad and river herring run above York Haven Dam (RM 56.1). However, the remaining portion of the American Shad and river herring run will be transported and discharged upstream of the Safe Harbor Dam (RM 32.2), rather than pass volitionally. To accomplish this, Constellation will transport American Shad and river herring from every fifth transport (20%) above Safe Harbor Dam, and the remaining four transports (80%) will be made above York Haven Dam. As the season progresses, the transport targets will be assessed on a weekly basis, and transports will be adjusted as needed to achieve the 80%/20% proportion

Constellation will also continue to monitor and remove the following invasive species during the 2023 fish passage season: Northern Snakehead (*Channa argus*), Blue Catfish (*Ictalurus furcatus*), and Flathead Catfish (*Pylodictis olivaris*). These species will be managed in accordance with Article 419 of the new license, paragraphs (b), (c), and (d) specifically collecting these species from both the EFL and WFL and placing them in totes and in a freezer that will be provided by MDNR. MDNR will remove the totes and beneficially reuse the aquatic invasive species. Constellation will also begin to monitor and alert the Resource Agencies if any of the following invasives are observed in the EFL or WFL during the 2023 fish passage season: Silver Carp (*Hypophthalmichthys molitrix*), Bighead Carp (*Hypophthalmichthys nobilis*) and Grass Carp (*Ctenopharyngodon idella*).

**Work Order Task Instructions**

- 1.---PROVIDE FOR DIVER INSPECTION OF SLOPED AREA OUTSIDE OF FISH ENTERANCE GATES. CHECK FOR ACCUMULATION OF SEDIMENT, ROCKS ETC.  
 \*\*\*\*\*NOTE\*\*\*\*\*  
 THIS WORK TO BE SCHEDULED AND COMPLETED IN CONJUNCTION WITH WEST FISH COLLECTOR DIVER WORK.
- 2.---UNWATER FISH TRAP FOR INSPECTION AND REPAIR OF ALL LOWER COMPONENTS LUBRICATE ALL LOWER COMPONENTS AS REQUIRED.
- 3.---OPEN MAIN AIR SUPPLY VALVE AND PURGE SYSTEM.
- 4.---CROWDER
  - A.--CHECK ALL AIR LINES AND CONNECTIONS.
  - B.--LUBRICATE ALL CABLES, SHEAVES AND PULLEYS, WHEELS AND ALL CROWDER MOVING PARTS AND MATING SURFACES.
  - C.--RE-INSTALL CROWDER AIR CYLINDERS AND CHECK OPERATION.

- D.--OPERATE AND LUBRICATE CROWDER DOORS AND DRIVE ASSEMBLY.  
CHECK / ADJUST ALL LIMITS AND STOPS.
- E.--CHECK / CORRECT TAKE-UP ON HOSE REELS. LUBRICATE AS REQUIRED.

## 5.---HOPPER

- A.--LUBRICATE ALL CABLES, SHEAVES, WHEELS AND ALL HOPPER MOVING PARTS AND MATING SURFACES.
- B.--CHECK CONDITION OF HOPPER AIR HOSES AND CONNECTIONS.
- C.--RAISE HOPPER TO TROUGH GATE. CHECK ALL LIMITS AND STOPS. LUBRICATE AS REQUIRED.
- D.--INSPECT HOPPER CHECK VALVES, GRATING AND SCREENING.
- E.--RE-INSTALL ALUMINUM SLIDE PLATES.
- F.--RE-INSTALL HOPPER AIR CYLINDERS.
- G.--OPERATE HOPPER DUMP DOORS AND INSPECT FOR WEAR OF SEALS. REPAIR AS NEEDED.

## 6.---GATES, SCREENS AND TRASH RACKS

- A.--CHECK ALL SETTINGS ON GATES, RACKS AND SCREEN LIMIT AND TORQUE SWITCHES. ADJUST AS REQUIRED. PROVIDE A WRITTEN REPORT OF AS-FOUND AND AS-LEFT SETTINGS.
- B.--INSTALL ALL TRASH RACKS AND SCREENS.
- C.--EXERCISE GATES, SCREENS AND RACKS. CLEAN AND LUBRICATE STEMS AND DRIVE OPERATORS.
- D.--LUBRICATE MAIN HOPPER HOISTS, TRASH RACK HOIST, SCREEN HOISTS AND MONORAIL HOISTS.
- E.--EXERCISE HANDWHEEL OPERATED TRASH RACKS AT HEADWORKS TRASH GATE.

## 7.---SORTING TANK WATER SUPPLY SYSTEM. DISREGARD THIS SYSTEM NOT IN USE

- A.--RE-INSTALL CASING PLUGS IN PUMP CASING.
- B.--LUBRICATE PUMP AS REQUIRED.
- C.--OPEN MAIN SUPPLY VALVE AND START-UP TANK WATER SUPPLY.
- D.--RE-ADJUST PUMP PACKING AS REQUIRED.
- E.--TEST SPRAYERS AND INSTALL STRAINERS.

DISREGARD THIS SYSTEM NOT IN USE. | 8&9 ¢

## 8.---PRIOR TO INSTALLATION OF STEEL PLATES "BURY"/ STORE TAILRACE STOPLOGS. \*NOT IN 1997 - B.P.

## 9.---INSTALL SIX (6) STEEL PLATES BETWEEN STOPLOG CRANE RAILS AT FISH TRANSFER AREA. INSTALL PORTABLE RAMP FOR FORK TRUCK.\*NOT IN 1997

## 10.--INSTALL VIEWING WINDOW GATE CYLINDER AND TEST.

## 11.--CLEAN ELEVATION MARKERS.

THE MAIN BREAKER AND EACH INDIVIDUAL BREAKER FOR THE ACTUATORS, SCREENS AND HOIST ARE IN THE GRAY BREAKER CABINET ON 48ELV. NEXT TO THE LIFT. THE MAIN BREAKER ALSO FEEDS THE CONTROL ROOM CAMERA ON TOP OF THE LIFT. IF YOU HAVE TO SHUT THE MAIN OFF NOTIFY THE CONTROL ROOM OPERATOR.

Conowingo Hydroelectric Project  
 FERC Project Number 405  
 Fishway Operation and Maintenance Plan – 2022 Annual Report

**APPENDIX H. AMERICAN SHAD OUTSIDE TESTING PROTOCOL DATA**

**Table X: Study and Control fish Outside Study Protocol – Number and %**

(DEMO days 5/18 - 5/19 not included in totals, but presented with strikethrough text for reference)

Table X shows the number of instances wherein violations to the study protocol occurred. The study protocol required steps that fall outside of routine processes for transferring American shad from the EFL to the WFL side and into transport trucks. As measurements, tagging, grouping, transporting, holding and documenting those activities are additions to the routine process for American shad, it is not unexpected that there would be study protocol violations, especially with such a large on-site crew.

Outside Protocol: Protocol specification violations included:

- Fish size too small and/or not aligned with specified blower speed for size
- Extended fish holding times
- Elevated blower speeds
- Insufficient water in WFL receiving tank\*
- Netting on WFL receiving tank obstructing fish water re-entry\*\*
- No control fish as comparison group, non-randomized group assignment

 Fishway Operation and Maintenance Plan – 2022 Annual Report

---

(DEMO days 5/18 and 5/19 are included in totals)

Table Y shows the combined data of Per Protocol and Outside the Protocol results, including the Demo Days which had no control group comparable. Looking at the combined data set of American shad (146 test group and 101 control group) the survival rates of each group were remarkably similar, and statistically insignificant (95% test group and 97% control group) even when including all fish outside the prescribed study protocol. The three mortalities on 5/16/22 driving the test group survival rates slightly lower are all attributed to study set up operation errors, fish exiting the Whooshh tube on top of netting spread over the receiving tank. In a non-study set up the fish would exit directly into the transport truck and such an operation oversight would never come into play. The three fish on the Demo Day are attributed to crowd anxiety handler error – in one case putting in the fish before the green light was on indicating system was ready, and the other two, by handler throwing the fish into the chute (rather than placing the fish and letting it slide) so the fish struck the gate prior to it opening. Do not use Table X or Table Y standing alone without context. See [Table 2.2.2.4.1-2](#) for corrected/correlated data set.

Fishway Operation and Maintenance Plan – 2022 Annual Report

---

**APPENDIX K. AGENCY COMMENTS AND RESPONSIVENESS SUMMARY ON 2022  
DRAFT FOMP ANNUAL REPORT**

Conowingo Hydroelectric Project  
 FERC Project Number 405  
 Fishway Operation and Maintenance Plan – 2022 Annual Report

**2022 Draft FOMP Annual Report– Resource Agency Comment Responsiveness Summary**

Comment	Response
USFWS, December 16, 2022	
<a href="#">Section 2.1.2</a> . Request that dissolved oxygen data for 2022 be reported for each day (including non-operational days) during the fish passage season after May 1.	Daily average dissolved oxygen data recorded from Station 643 has been included for non-operational days during the fish passage season (after May 1).
<a href="#">Section 2.1.2</a> . Water temperature data is required to be collected daily during the fish passage season per the 2022 FOMP (Section 7.1, bullet 4, footnote 25) and the 2021 FERC License (Table 9, footnote 1 and fishway prescription Section 12.4, bullet 3 under Annual Reporting Requirements). However, temperature data is only provided for fishway operational days. Request to include daily temperature data from Station 643, where available between May 1 through June 15, in addition to data collected at the WFL during fish passage operation.	Daily average water temperature data recorded from Station 643 has been included for non-operational days during the fish passage season (after May 1).
<a href="#">Figures 2.1.2-1</a> and <a href="#">2.1.2-2</a> . Add water temperature and dissolved oxygen to the figures for non-operational days to the extent available (per comments on <a href="#">Section 2.1.2</a> ).	Daily average dissolved oxygen data and daily average water temperature data recorded from Station 643 has been included for non-operational days during the fish passage season (after May 1).
<a href="#">Figure 2.1.2-2</a> . Please verify the water temperature reading on May 24, 2022.	The daily average water temperature on May 24, 2022, has been corrected to 63.0 °F. The draft report incorrectly provided the daily average air temperature, which was 45.5 °F.

Conowingo Hydroelectric Project  
 FERC Project Number 405  
 Fishway Operation and Maintenance Plan – 2022 Annual Report

Comment	Response
<a href="#">Section 2.2.2.4.1</a> . An asterisk is present within the first paragraph on <a href="#">pg. 16</a> . Please verify if there should be a corresponding footnote.	The asterisk present within the first paragraph on pg. 16 was inserted in error. Constellation has removed it from the text.
<a href="#">Table 2.2.2.4.1-2</a> . Please specify that the table refers to American Shad.	The title has been revised to specify that the table refers to American Shad.
<a href="#">Appendix F</a> . Please add a unique number to each transport in the tables to make it possible to identify transports that contained fish from both lifts and/or were of mixed species.	Constellation has included an additional table to Appendix F which summarizes transport data by individual transport numbers.
<a href="#">Appendix F</a> . Please add minimum and maximum water temperatures and dissolved oxygen readings for each transport.	Constellation has included an additional table to Appendix F which provides the minimum and maximum water temperatures and dissolved oxygen readings for each transport.
Maryland (MDE working with MDNR), December 16, 2022	
<a href="#">Table 2.2.1.3.1-1</a> . Please provide text in the report that discusses the sacrifices and mortalities noted in the tables.	Constellation has added text discussing the sacrifices and mortalities noted in <a href="#">Table 2.2.1.3.1-1</a> .
<a href="#">Table 2.2.1.3.1-1</a> . Please provide detail regarding the difference between northern snakehead ‘collected’ and ‘sacrificed’.	Constellation added text clarifying that the difference between Northern Snakehead “collected” and “sacrificed” in Table 2.2.1.3.1-1 is due to one escaping (leaping) from the WFL sorting tank prior to the technicians entering the WFL sorting tank.

Conowingo Hydroelectric Project

Fishway Operation and Maintenance Plan – 2022 Annual Report

---

Comment	Response
<a href="#">Table 2.2.2.3.1-2</a> . Please provide text in the report that discusses the sacrifices and mortalities noted in the tables.	Note, <a href="#">Table 2.2.2.3.1-2</a> provides a summary of floy-tagged American Shad collected at the EFL, whereas <a href="#">Table 2.2.2.3.1-3</a> summarizes the EFL counts. Constellation has added text discussing the sacrifices and mortalities noted in <a href="#">Table 2.2.2.3.1-1</a> .
<a href="#">Table 2.2.2.4.1-2</a> . The Table should indicate these were American Shad.	The title has been revised to specify that the table refers to American Shad.

Ms. Gorski,

Thank you for the opportunity to provide comments on the Draft Conowingo FOMP for 2023. The Service submits the following comments and recommended edits for your consideration:

- In the Introduction, it would be helpful to provide a brief bulleted list of items that have changed in this FOMP compared to the previous FOMP.
- Section 4.3.1.1: Although it is assumed, it may be useful to new readers to indicate that all fish not removed for transport or for AIS disposal are returned to the tailrace.
- Section 4.6:
  - Bullet 2 – Daily water temperature and dissolved oxygen (DO, after May 1) data are to be collected daily at the fish lifts and in the tailwater area. Those data were not fully collected/reported in the 2022 FOMP Report. In 2023, daily water temperature collection and reporting should occur for each day (including non-operational days) of the fish passage season. In addition, if water temperatures are collected at Station 643 after May 1, please include those data in the annual report in addition to temperatures collected daily at the WFL. Temperature data from Station 643 should not replace WFL temperature monitoring unless concurrent sampling at both stations can demonstrate that similar data are collected at both locations. In addition, tracking DO concentrations in water flowing from Conowingo Pond into the WFL is critical to ensuring that sufficient DO concentrations are present for fish entering the WFL during the latter (warmer) part of the season. The Service requests collection of DO data to occur daily at the WFL location during the entire fish passage season. Monitoring of DO at the WFL could be discontinued after May 1 if concurrent sampling between the WFL and Station 643 show similar data are being collected at both locations.
  - Last Bullet - Please replace the text to reflect this updated collection protocol for river herring: *River herring will also be sacrificed for biological information. Every 20th river herring of each species (Alewife and Blueback Herring) will be sacrificed with a maximum collection of 50 individuals per species from the project. River herring will be processed similar to American Shad. Additionally, any river herring mortalities resulting from lifting, sorting, handling, or transporting will be retained*

*for analysis.*

Let me know if you have any questions or would like a meeting to discuss these items further.

**Subject:** [EXTERNAL] Conowingo Fishway Operations and Maintenance Plan for the 2023 passage season

**This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.**

Hello,

Please see the attached the Constellation Conowingo Fishway Operations and Maintenance Plan for the 2023 passage season.

 [Conowingo\\_FOMP\\_2023.pdf](#)

Constellation is requesting that comments be provided to Andrea Danucalov by December 17, 2022 so that the final report can be filed with FERC.

Thank you,  
Kendra

CAUTION: This email originated from outside of GSE. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Ms. Gorski,

Thank you for the opportunity to provide comments on the Draft Constellation 2022 Annual FOMP Report. Maryland (MDE working together with MDNR) has the following comments:

Table 2.2.1.3.1-1

- Please provide text in the report that discusses the sacrifices and mortalities noted in the tables.
- Please provide detail regarding the difference between northern snakehead ‘collected’ and ‘sacrificed’.

Table 2.2.2.3.1-2

- Please provide text in the report that discusses the sacrifices and mortalities noted in the tables.

Table 2.2.2.4.1-2

- The Table should indicate these were American Shad.

Hello,

Please see the attached Constellation Conowingo Fishway Operations and Maintenance Plan

Annual Report Draft for 2022. This report is business confidential.

 [2022\\_Conowingo\\_FOMP\\_Annual\\_Report.pdf](#)

As Kirk said on today's EPAG call, this draft report covers the eel season through September 15, 2022, then it will be updated to provide data after 9/15 to end of season.

Constellation is requesting that comments be provided to Andrea Danucalov by December 17, 2022, so that the final report can be filed with FERC by the close of the year. The final report will also include DO data from the collection tank.

Let me know if you have any issues assessing the report.

Thank you,

Kendra
